

Bachelor in Management and Technology TUM (Campus Heilbronn)

May 19th, 2026

Falk Bäurle
COO/CFO

- 1. Introduction** ca. 20 min
 - Falk Bäurle + Team
 - SCHUNK: the Company, the Products, the Business
- 2. Investment Theory** ca. 45 min
- 3. Impulse: Working @ SCHUNK** ca. 5 min
- 4. Impulse: CFO Organization and AI in Finance** ca. 5 min
- 5. Q+A Session** ca. 15 min

Falk Bäurle – COO/CF0

Key Facts

- Born in 1982, raised in Stuttgart
- Married, two sons
- Diploma in Economics, University of Mannheim

Professional Experience

- PwC (2008–2012), Frankfurt
- Knorr-Bremse (2012–2016), Munich
- Dürr / teamtechnik / BBS Automation (2016–2025), Bietigheim, Munich

Privat

- Family, Sports, Hiking, Capital Markets

Company Presentation

Our corporate values

Friedrich Schunk
Founder

Henrik A. Schunk
Chairman of the Board
Grandson of the founder

Kristina I. Schunk
Chairwoman of the Management Board/CEO
Granddaughter of the founder

Heinz-Dieter Schunk
Honorary Chairman of the Board
Son of the founder

From a workshop to a partner for productivity

– headquarters Lauffen/Hausen

Technology pioneer in toolholding and workholding, gripping and automation technology

More than **13,000**
components

€600 million
turnover 2024

2,000
customized solutions
per year

10 plants
34 locations
3,700 employees

8.5%
R&D investment ratio

SCHUNK is close to you – worldwide

In more than 75 countries

+ 34 directly owned subsidiaries

+ 32 distribution partners

+ 10 production plants

**Tool and mold
making industry**

Energy

**Metal cutting
industry**

Industrial robots

Plastic

Aerospace

**Casting and
forging**

Optical industry

**Metal products
and fittings**

Investment Theory

Understanding how to evaluate investments...

Understand the fundamentals of investment decisions

Distinguish between static and dynamic evaluation methods

Apply investment appraisal techniques to real-world cases

Incorporate risk and strategic considerations into decision making

... at the end, it's about generating value

Investments involve (mostly) mid- to long-term capital commitment

Types of investments: tangible, financial, and intangible investments

Stakeholders: various stakeholders involved – leadership, operations, controlling, treasury etc.

Objective: generate value. Different methods to evaluate an investment opportunity respectively approach “value generation”

Time value of money as key difference between concepts of evaluating investment decisions

Static Methods

- Cost Comparison Method
- Return on Investment (ROI)
- Profit Comparison Method
- Payback Period

PRO

Easy (and quick) to calculate
Good measure of liquidity risk

CON

Ignores the time value of money (assumption: money today is worth the same as money tomorrow)
No clear link to value maximization

Dynamic Methods

- Net Present Value (NPV)
- Internal Rate of Return (IRR)
- Annuity Method
- Discounted Payback Period

Accounts for the time value of money (assumption: money today is worth more than money tomorrow)
Directly tied to shareholder wealth (especially NPV)

Requires an accurate estimate of the Cost of Capital
More complex to calculate and explain to non-financial managers

SCHUNK manufactures a broad range of products with highly automated machines

Economic value drivers
e.g.,

Labor savings

Lower scrap

Higher OEE

Less maintenance

Invest (cash-outflow) followed by (net) cash-inflows

t	0	1	2	3	4	5	6	7
Cash-outflows	-500			-30			-30	
Cash-inflows		125	125	125	125	125	125	125
Cash-out-/inflows (cumulated)	-500	-375	-250	-155	-30	95	190	315

Comments

- Cash-outflows, esp. related to CAPEX (capital expenditure) and maintenance / life cycle repairs
- Initial investment: 500
- Useful life: 7 years (assumption)
- Discount rate: 10%

Should we invest – yes/no?

Static method – Payback Period

Comments

- Payback period = investment / annual (net) cash-inflows
→ $500 / 116 = 4.5$ years
- Payback period is a **liquidity-focused measure** that does not consider (net) cash-inflows after payback. **Used very often in practice**
- Payback period (undiscounted) at **4.5 years**

The Weighted Average Cost of Capital (WACC) as a way to assess the required rate of return

Calculating WACC: Formula Breakdown

WACC is found by determining the proportions of debt and equity financing that a company uses to determine the total cost of capital. The equation is:

$$\text{WACC} = \left(\frac{E}{V} \times Re \right) + \left(\frac{D}{V} \times Rd \times (1 - Tc) \right)$$

where:

E = Market value of the firm's equity

D = Market value of the firm's debt

$V = E + D$

Re = Cost of equity

Rd = Cost of debt

Tc = Corporate tax rate

Dynamic method – Net Present Value (NPV)

t	0	1	2	3	4	5	6	7
Cash-outflows	-500			-30			-30	
Cash-inflows		125	125	125	125	125	125	125
		125	125	95	125	125	95	125

WACC 10%

Discounted

Net Present Value Factor	1,00	0,91	0,83	0,75	0,68	0,62	0,56	0,51
Cash-out-/inflows (cumulated)	-500	114	103	71	85	78	54	64

NPV 69

Comments

- $NPV = \sum CF / (1+r)^t$
- WACC = 10%
- If $NPV > 0 \rightarrow$ accept
- If $NPV < 0 \rightarrow$ do not accept

Dynamic method – Internal Rate of Return (IRR)

t	0	1	2	3	4	5	6	7
Cash-outflows	-500			-30			-30	
Cash-inflows		125	125	125	125	125	125	125
		125	125	95	125	125	95	125

IRR 14%

Discounted

Net Present Value Factor	1,00	0,88	0,77	0,67	0,59	0,52	0,45	0,40
Cash-out-/inflows (cumulated)	-500	110	96	64	74	65	43	50

NPV 0

Comments

- $NPV = \sum CF / (1+IRR)^t = 0$
(IRR/discount rate where $NPV = 0$)
- IRR = 14,1% (Excel: "goal seek")
- WACC = risk-adjusted required return
- If $WACC < IRR \rightarrow$ accept
- If $WACC > IRR \rightarrow$ do not accept

Dynamic method – Discounted Payback Period

Comments

- Payback period = investment / discounted annual (net) cash-inflows
 $\rightarrow 500 / 81 = 6.2$ years
- Payback period (discounted) at 6.2 years**

Sensitivity can help – exemplary based on NPV method

		Initial investment						
		400	450	500	550	600	650	700
WACC	8%	208	158	108	58	8	-42	-92
	9%	188	138	88	38	-12	-62	-112
	10%	169	119	69	19	-31	-81	-131
	11%	151	101	51	1	-49	-99	-149
	12%	134	84	34	-16	-66	-116	-166

Open discussion...

When is a short payback more relevant than a higher Net Present Value (NPV)?

Investment decisions shape long-term competitiveness – 1x metric is not enough

Method	Result
Payback Period	4.5 years
Net Present Value (NPV)	69
Internal Rate of Return (IRR)	14.1%
Discounted Payback Period	6.2 years

Sensitivity analysis can help to identify critical variables, break-even assumptions and risk exposure

Combining several methods improves decision quality. Financial metrics combined with operational realism and risk considerations are essential in practice

Development projects mostly with typical „bathtub“

Comments

- NPV = 696 (@ 10% WACC)
- Payback = 6.3 years

M&A projects make use of different valuation methods – esp. multiples, DCF

t	1	2	3	4	5	TV
Free Cashflow	100	120	144	173	207	216
WACC	10%					
TVG	2%					
<u>Discounted</u>						
Net Present Value Factor	0,91	0,83	0,75	0,68	0,62	7,76
Discounted Free Cashflow	91	99	108	118	129	1.674
DCF-Value	2.219					

Comments

- Business Case in general 3–5 years for established businesses
- DCF = discounted cashflow. Free cashflow to the firm, i.e., debt-/equity-stake-holders (entity value)

Value drivers:

- denominator: terminal value growth rate (TVG), WACC;
- numerator: business plan (P&L, Balance Sheet)

Innovation: Humanoid Robotics

From Gripper to Anthropomorphic Hand

AI as an enabler. Hand in hand for tomorrow

Tech-Spin-off for Humanoid Robotics Hands

SCHUNK has found a Spin-off for Humanoid Robotics Hands!

Let's get in touch and join us now!

SCHUNK gründet Tech-Spin-off für humanoide Roboterhände

Mit der Ausgründung eines eigenen Spin-offs Anfang Januar bündelt SCHUNK seine Aktivitäten in der humanoiden Robotik und positioniert sich als Schlüsselakteur im wachsenden Markt. Ziel des neuen Unternehmens ist die Entwicklung modularer humanoider Roboterhände für industrielle Anwendungen, um die Verfügbarkeit und den Einsatz humanoider Systeme konsequent auszubauen.

Das neu gegründete SCHUNK-Spin-off bündelt Kompetenzen im Bereich humanoider Robotik, um deren Einsatz in Industrieanwendungen skalierfähig auszubauen.

SCHUNK treibt als Technologiepionier die industrielle Weiterentwicklung humanoider Robotik voran. Auf Basis jahrzehntelanger Erfahrung in flexibler Greiftechnik und in Zusammenarbeit mit Industrieunternehmen, Start-ups und Forschungseinrichtungen erschließt das Unternehmen mit seiner 5-Finger-Greifhand bereits seit mehr als zehn Jahren neue Anwendungsfelder jenseits des rein wissenschaftlichen Umfelds. Das neu gegründete Tech-Spin-off SCHUNK.

Q&A

Hand in hand for tomorrow
